Reply to Advisory Action of April 5, 2005 and Office Action of December 14, 2004

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

- 1. (Currently amended) An apparatus for piercing container caps, comprising:
 - a) a piercing blade having a longitudinal axis and a zigzagged cross-section that is perpendicular to said axis;
 - b) an alignment arm for moving said blade in a linear motion along said longitudinal axis to pierce a cap on a container, comprising a carriage assembly for moving said alignment arm, wherein movement of said blade is limited to <u>linear motion along</u> said longitudinal axis; and means for driving said carriage assembly.
- 2. (Original) The apparatus as defined in claim 1, wherein said piercing blade has at least one sharpened tip for piercing a cap of a container and spreading the load applied on the blade.

3. (Cancelled)

4. (Original) The apparatus as defined in claim 1, further comprising an alignment block assembly for restraining said container when said piercing blade is being withdrawn after piercing a cap.

Appl. No. 09/780,804

Amdt. Dated May 13, 2005

Attorney Docket No. 81841.0183 Customer No. 26021

Reply to Advisory Action of April 5, 2005 and Office Action of December 14, 2004

5. (Original) The apparatus as defined in claim 4, further comprising a latch

assembly for latching said alignment block assembly when said piercing blade is

being withdrawn from a pierced cap to prevent said container from being moved by

friction with said withdrawn blade.

6. (Original) The apparatus as defined in claim 5, wherein said latch

assembly further comprising a trigger movable between a latching position when

said piercing blade is being withdrawn from a pierced cap and an unlatched position

after said piercing blade has been withdrawn from said pierced cap.

7. (Previously Presented) The apparatus as defined in claim 6, wherein said

latch assembly further comprising an actuator engaged with said trigger, wherein

the actuator has locking means, such that when said trigger moves to said latching

position, said actuator causes its locking means to matingly lock with a fixed

complimentary locking means to latch said alignment assembly, and when said

trigger moves to said unlatched position, said actuator causes its locking means to

unlock from said fixed complimentary locking means to unlatch said alignment

assembly.

8. (Original) The apparatus as defined in claim 7, wherein said locking means

of said actuator and said fixed complimentary locking means are gear rack teeth.

9. (Original) The apparatus as defined in claim 7, wherein said locking means

of said actuator and said fixed complimentary locking means are saw teeth.

10. (Original) The apparatus as defined in claim 7, wherein said actuator is spring-biased.

11-20. (Cancelled)

- 21. (Currently amended) An apparatus for piercing container caps, comprising:
 - a) a piercing blade having a longitudinal axis and a zigzagged cross-section that is perpendicular to said axis;
 - b) an alignment arm for moving said blade in a linear motion along said longitudinal axis to pierce a cap on a container, wherein movement of said blade is limited to <u>linear motion along</u> said longitudinal axis; and
 - c) means for preventing said container from being moved by friction with said blade when said blade is being withdrawn from a pierced cap.
- 22. (Previously Presented) The apparatus as defined in claim 21, wherein said piercing blade has at least one sharpened tip for piercing a cap of a container and spreading the load applied on the blade.
- 23. (Previously Presented) The apparatus as defined in claim 21 further comprising:
 - a) a carriage assembly for moving said alignment arm; and
 - b) means for driving said carriage assembly.

Amdt. Dated May 13, 2005 Reply to Advisory Action of April 5, 2005 and Office Action of December 14, 2004

24. (Previously Presented) The apparatus as defined in claim 21, wherein said preventing means comprises an alignment block assembly for restraining said

container when said piercing blade is being withdrawn after piercing a cap.

25. (Original) The apparatus as defined in claim 21, wherein said preventing

means further comprises a latch assembly for latching said alignment block

assembly when said piercing blade is being withdrawn from a pierced cap to prevent

said container being lifted up by friction with said withdrawn blade.

26. (Original) The apparatus as defined in claim 25, wherein said latch

assembly further comprises a trigger movable between a latching position when

said piercing blade is being withdrawn from a pierced cap and an unlatched position

after said piercing blade has been withdrawn from said pierced cap.

27. (Previously Presented) The apparatus as defined in claim 26, wherein

said latch assembly further comprises an actuator engaged with said trigger,

wherein the actuator has locking means, such that when said trigger moves to said

latching position, said actuator causes its locking means to matingly lock with a

fixed complimentary locking means to latch said alignment assembly, and when

said trigger moves to said unlatched position, said actuator causes its locking means

to unlock from said fixed complimentary locking means to unlatch said alignment

assembly.

28. (Original) The apparatus as defined in claim 27, wherein said locking

means of said actuator and said fixed complimentary locking means are gear rack

teeth.

- 29. (Original) The apparatus as defined in claim 27, wherein said locking means of said actuator and said fixed complimentary locking means are saw teeth.
- 30. (Original) The apparatus as defined in claim 27, wherein said actuator is spring-biased.
 - 31. (Cancelled)
